

Syllable slam

How many syllables are there in a word? We all know the answer when we see a word, but can we teach a computer to do that as well?

Task

From `stdin` take a list of words, one per line. The output (to `stdout`) will just be a list of integers, one per line, representing your program's estimate of the number of syllables of each word.

The main purpose of this étude is to get you working with your group – during the lab on July 13 you should be able to discuss the problem, come up with some strategies for solving it, and write a program to implement your chosen solution. There is no “right” answer, but your solution will be compared to the other groups' in the town hall on July 16, so as a matter of pride I suggest that you not submit a program that says that `cow` has 14 syllables, or that `algorithmically` has one.

This étude must be completed by July 15, 2015 and emailed to `mark326` so that the results can be discussed and compared in the town hall on July 16.
